Evaluating the impacts of **RainWater Harvesting (RWH)** in the Arvari River, India

Claire Glendenning
Supervisor: Dr Willem Vervoort

Faculty of Agriculture, Food and Natural Resources
The University of Sydney

Groundwater in India

- World's largest user
- ~ 80% rural domestic use
~ 45% for irrigation
- <1 million tubewells (1960)
to 20 million (2000)
- Common resource = Decline
- Management option:
Rainwater Harvesting (RWH)?

What is Rainwater Harvesting?

- collect/store RUNOFF for DIRECT USE or RECHARGE

September 06

December 06

RWH in India

- > 1000 years in India
- Monsoon: 100 hr rainfall (80 days)/yr
RWH=more time for recharge
- past neglect, now large reinvestment
- Impacts?

Quantified field studies of RWH

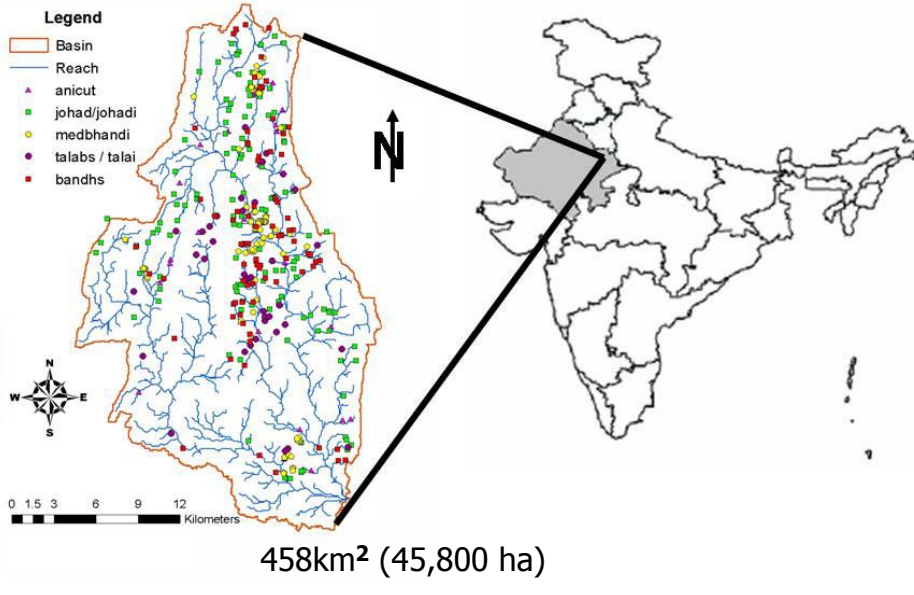

- Recharge = 3 – 8 % P: WTF
(Badiger et al. 2002)
- Local impact on groundwater levels:
1 structure (Neumann et al. 2004, 2005)
- Limiting capacity to induce recharge
WTF / water balance in 812 ha
(Sharda et al. 2006)
- Hydrological catchment impacts not known
(Calder et al. 2006, Kumar et al. 2006)

How to evaluate **RWH** impacts?

1. Field-scale impacts of RWH
2. Catchment-scale impacts of RWH
 - a. Build a conceptual water balance model
 - b. Run scenarios to investigate RWH impacts

Case Study Location

28 Anicuts

84 Bandhs

127 Johads

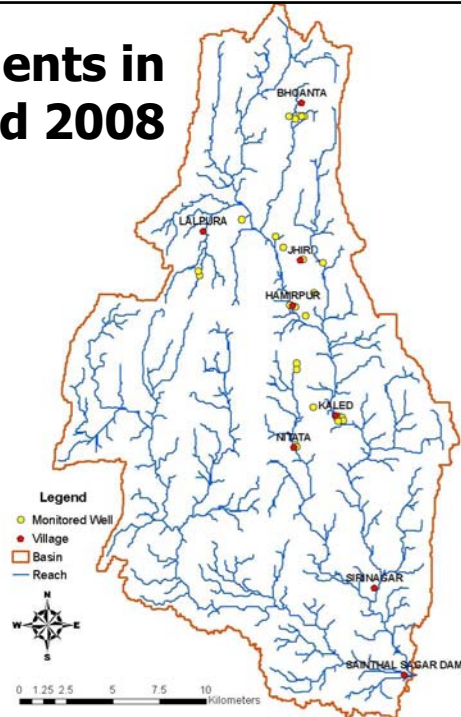

88 Medbandhi

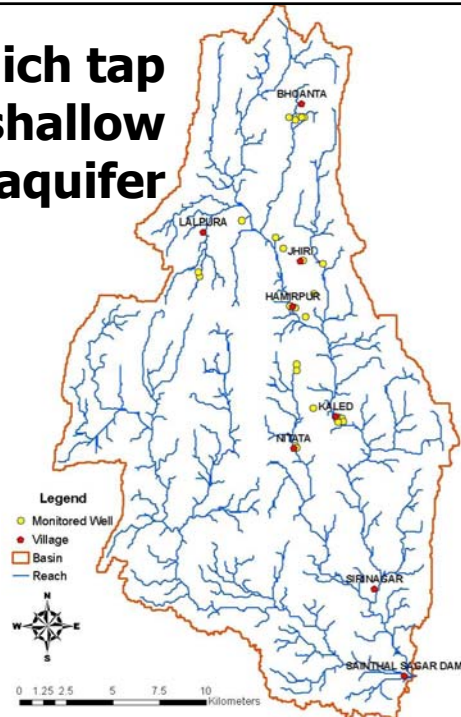

Daily measurements in monsoon 2007 and 2008

Monitoring Network

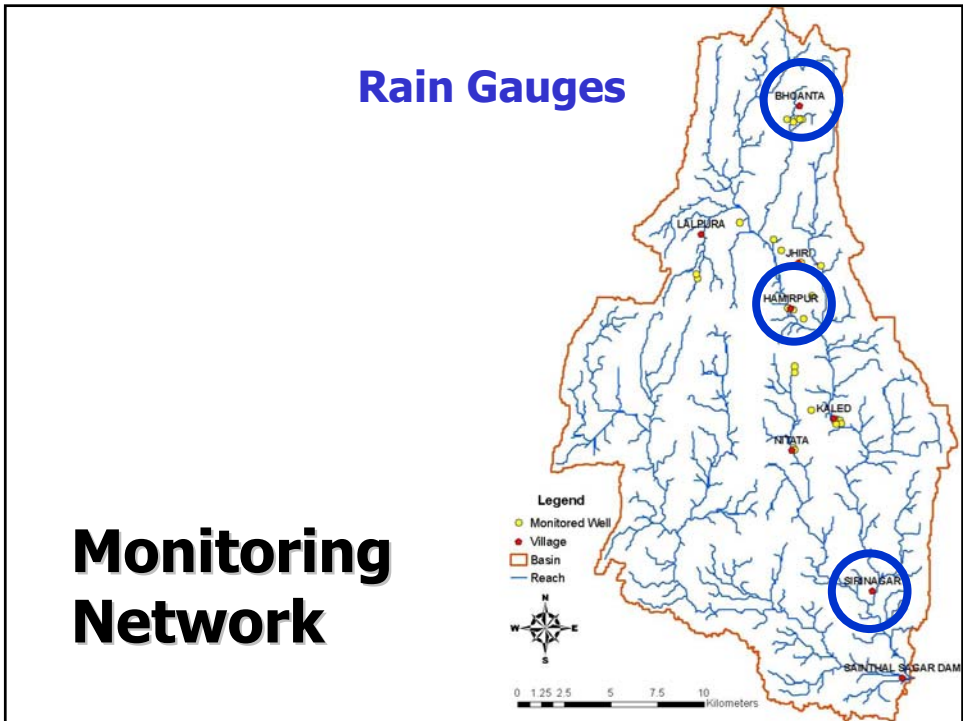

29 dug wells which tap unconfined/shallow aquifer

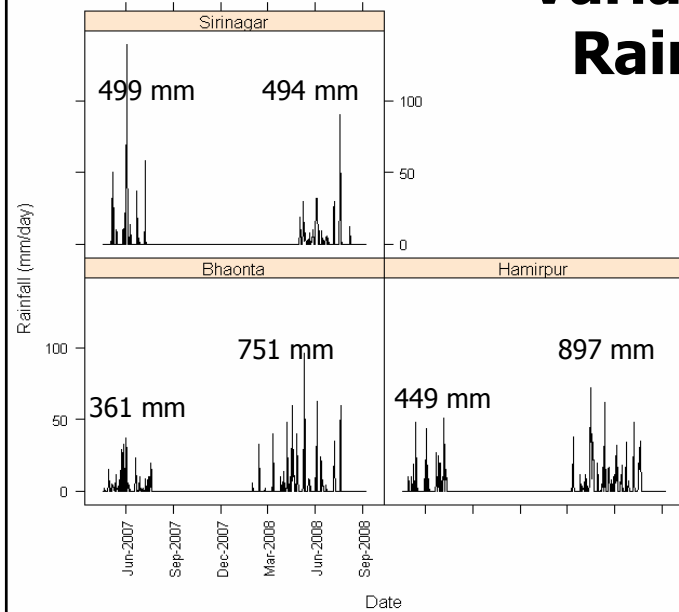

Monitoring Network

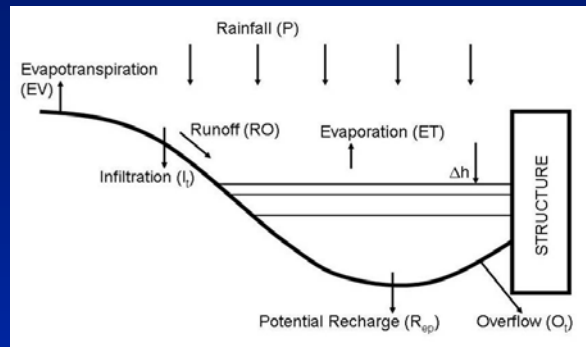

Variability of Rainfall (P)

Potential Recharge (R_{ep}) estimates

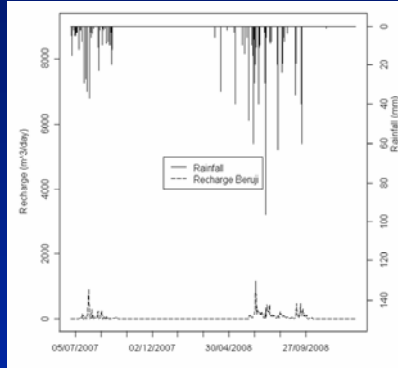

$$R_{ep} = -A_s \cdot \Delta h - ET - O_t \text{ non-rainy days}$$

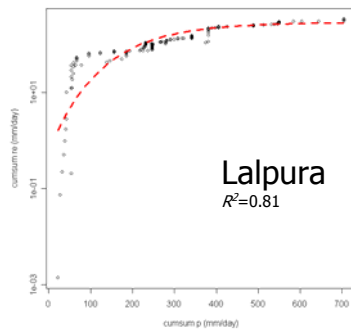

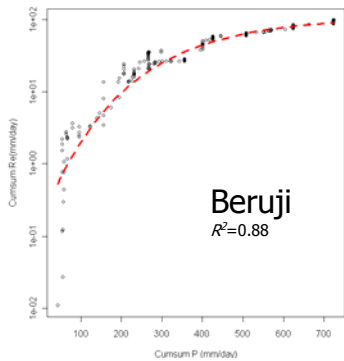

$$R_{ep} = ah_{av}^b \text{ rainy days}$$

(Sharda et al. 2006)

R_{ep} estimates (m^3/day)

RWH Structure	R_{ep} mm/day		Days Storage		% P \rightarrow R_{ep}	
	2007	2008	2007	2008	2007	2008
Sankara Bandh	45	55	169	260	14	22
Beruji Bandh	20	27	138	201	8	10
Jhiri Johad	12	19	273	+270	6	8
Lalpura Johad	15	23	240	+270	6	8

Cumulative sum R_{ep} and Cumulative sum Rainfall relationship

= RWH limited capacity to induce more recharge

Bhaonta: well heights asl (m)

Bhaonta: relative well heights

Well Response

Water Table Fluctuation Method Recharge Estimation

$$Re = Sy \cdot \frac{\Delta h}{\Delta t}$$

2007

- Legend**
- ◆ Wells 2007
 - Re (mm/day) 2007
 - 0 - 2.5
 - 2.5 - 5
 - 5.0 - 7.5
 - 7.5 - 10
 - 10 - 12.5
 - 12.5 - 15
 - 15 - 17.5
 - 17.5 - 20
 - 20 - 22.5

2008

- Legend**
- ◆ Well 2008
 - Re (mm/day) 2008
 - 0 - 2.5
 - 2.5 - 5
 - 5 - 7.5
 - 7.5 - 10
 - 10 - 12.5
 - 12.5 - 15
 - 15 - 17.5
 - 17.5 - 20
 - 20 - 22.5

Comparison of recharge estimates

River flow

Anicut	Average Re mm/day
Hamirpur	44
Kaled	25
Nitata	42

Recharge from Anicuts on River

Field-Scale Characteristics

- High inter/intra-annual P variability
- RWH
 - 12-55 mm/day \sim 170-260 storage days
 - Dependent on P, but limiting capacity
 - Difference btw *Johad* / *Bandh*
 - \sim 7% P $\rightarrow R_{ep}$
- Wells and Groundwater
 - No baseflow, high lateral flow
 - Annual fluctuation
